Demo Speaker Notes

AI Sales Workstation — guided walkthrough

Showcase customer: **Klaus Fischer** (pet & extreme-sport signals, property-financing lead). Swap the name if you use a different record.

Opening — why we built this

*"Over the next ten minutes or so, I will show you our so-called **AI Sales Workstation**. The whole point is to get **out of PowerPoint** — to have something tangible we can put in front of **our clients** and actually discuss with them, instead of another slide deck. It makes two things real: **Open Finance**, and simple, **AI-supported sales**."*

*"We have built three click-paths: **banking**, **insurance** and **wealth management**. Today I will walk you through the **banking** journey."*

0. Landing page (start)

*"Let me start where the advisor starts every morning. Normally that means jumping between a **CRM, Excel and Outlook** just to organize the day. Here, instead, there is **one platform that connects it all**. The advisor simply tells the assistant what they need — or picks a quick action like Sales Cockpit, Upcoming Meetings or Prepare Meeting. One click and we are in."*

*"So this landing page is already the **single platform** the advisor needs — all the data comes together right here, in one place."*

Do · Point to the personalized greeting and the quick-prompt chips. Click **Sales Cockpit**.

1. Cockpit / Overview — "what the advisor sees at a glance"

"This is the cockpit. In one view the advisor sees their day, KPIs, open potentials and tasks — all pre-prioritized by AI. The interesting part is how the system finds opportunities. Several engines work in the background."

Life-Event Radar

"The Life-Event Radar detects life events from real signals — account activity, newsletter clicks, public registers. It spots a new baby, a switch to self-employment, an upcoming retirement, scores the confidence and attaches a concrete revenue potential. The advisor does not go looking — the moment of need comes to them."

Churn Radar

"The Churn Radar is the mirror image: it flags customers about to leave — a salary moving to a competitor, a portfolio quietly migrating to Trade Republic, or on the insurance side a FiDA data request from a rival. Each at-risk client comes with a CLV-at-risk figure, so the advisor knows where retention effort pays off."

Marketing Campaigns

*"Now look at the marketing campaigns. The key point: these are **not** broadcast to everyone. The customers you see matched here were assigned to each campaign **based on their actual potential and signals**. So instead of cold-calling down a list like in the old days, the advisor approaches **exactly the right customers** with a relevant, well-timed offer."*

Individual Product Modules (hyper-personalized)

*"And this is the real shift: away from **off-the-shelf products**. Using our own **data points**, we can **assemble new products individually** — tailored to the customer's actual situation instead of picking from a fixed catalogue. Each module here carries a unique USP component and is already matched to the existing customers who fit it."*

*"Naturally, how quickly we can spin these up depends on our **release cycles** supporting it — but the direction is clear: from standard products to **individually composed** ones, in days rather than months."*

Do · Open a product card to show the USP module + matched customers; mention the time-to-market / release-cycle figures on the card.

Transition → finding new potentials

*"So now I have the full picture — marketing campaigns, the Life-Event Radar and the Churn Radar. I also notice that my **next appointment is still a little while away** — so I will use that time to go looking for **new potentials**. And the easiest way to do that is to just ask the assistant."*

2. The AI Sales Assistant (chatbot) → Leads

"Everything I just clicked, the advisor can also simply ask. This is the AI Sales Assistant. Let me ask it for my new leads."

Do · Open the chatbot, click **My new leads**.

"It pulls the top potentials straight from the live data — same numbers as the board, no hand-maintained list. And it points me to where I can work them: the Potentials tab."

Do · Follow it into **Leads / Potentials**.

3. Potentials — the Kanban board

"This is the pipeline as a Kanban board. Every potential is a card with its value, priority, source and a one-line AI rationale. The advisor works it like a sales funnel — from Identified to Contacted to Appointment to Closed."

"Importantly, the advisor stays in control of the AI. If a suggestion does not fit, they just drag the card to Not relevant — and that feedback trains the model. You can see it: the hit-rate already improved from 78% to 86% because the advisor corrected it."

Do · Drag a card into the **Not relevant** column; point to the hit-rate line.

4. Open the showcase customer (Klaus Fischer) → Master Data

"Let me open our showcase customer, Klaus Fischer. This is the 360-degree view, and at the top the AI has already written a summary and a recommendation — so the advisor walks into every conversation prepared."

*"Look at the data quality: his employer is confirmed via account activity, his job title verified via LinkedIn. And these two signals — the system detected a **pet** purely from recurring account transactions, and **extreme-sport activity** from his spending pattern. A pet means liability and health cover; extreme sport changes the risk profile for disability and life insurance. The advisor sees needs the customer never mentioned."*

Do · Point to the AI Summary card, the "confirmed via account activity" / LinkedIn badges, and the **pet** and **extreme-sport** signals.

5. Financial Overview

"Switching to the financial overview: income, savings rate, freely available liquidity, coverage score, creditworthiness, CLV — consolidated across all sources, including open-finance data from other banks. The advisor instantly sees where the customer is over- or under-covered, and the AI adds a concrete next-best-action."

Do · Walk through the key figures; highlight the coverage score and the AI recommendation.

6. The customer's Leads

"And here are Klaus Fischer's individual leads — each derived from a signal, with its rationale, expected value and next step. This is the bridge from insight to action."

Do · Open the **Leads** tab on the customer.

7. Showcase lead — financing → outreach → appointment

"Let me take the headline lead: the property-financing conversation. His existing loan is running out, his building-savings contract is ready to be paid out, and he has been reading the property newsletter for two years — the timing is perfect."

"With one click I let the assistant draft the outreach — personalized, in the customer's tone, ready to send."

Do · Open the financing lead → trigger **draft outreach / letter** in the assistant.

"I send it, and straight away I book the appointment — no switching tools."

Do · Create the **appointment**.

8. The finale — AI meeting preparation

"This is where it all comes together. The moment the appointment is set, the AI prepares the meeting: it pulls the customer's situation, the relevant signals, the right product, talking points and likely objections into a single briefing. The advisor does not spend an evening preparing — they walk in ready to advise."

"From an anonymous signal in the data, to a detected need, to a tailored product, to a booked appointment with a full AI briefing — that is the whole value chain, in one workstation."

Do · Open the **AI meeting preparation** modal as the closing image.

9. Closing remark — manual today, automatable tomorrow

*"One important thing to close with: we just went through this click-path **actively and by hand** — clicking every step ourselves so you can see exactly what happens. But everything the tool does here can also be **processed automatically** in the background: the radars, the matching, the outreach, even the meeting preparation could be triggered without a single click."*

*"We deliberately kept it hands-on and did **not** put that automation front and centre here — so that the **use case stays clear and easy to follow**. The point today is the value chain; the level of automation is then a design decision we make together with you."*
