Speaker notes: Claude Code pilot, food for thought (English)

Talk version, as of 24 September 2026

FRAME

Eike opens with the plan for today (possibilities of AI including Claude Code, a short insight into a real demo, a pointer to the hackathon planned in the background), then gives a short insight in the Claude Code pilot into what AI can already build today, leads into the Open Finance prototype and shows the AI sales workstation live. Duration 8 to 9 minutes at a calm pace, about 1,200 spoken words.
Dramaturgy: context first (with AI we build pitches, workshops and greenfield solutions ourselves; Eike in the Claude Code pilot, larger company rollout planned; hackathon in Banking in Q4 with Claude Code access for every participant; side note Copilot and Mindflow for simple click paths and ready-made agents, the missing backend via Claude Code), then the four fields on one slide (workflows: used with ERGO for the target process, now in implementation), then the focus on Open Finance (discussed with many clients, shown today in the webcast with Marie, FiDA discussions, Claudeforce since August 2026), then the 4-minute demo with the same click path as in Banking Horizon 2030, closing with the hackathon. Anyone who has to fit into 8 minutes cuts the master data and the radar examples in the demo to one sentence each.

RUNNING ORDER

0:00	Opening: what I will do today	30 seconds
0:30	Context: what AI can already build	1 minute
1:30	Slide 1: Four fields	1 minute 45
3:15	Slide 2: Focus on Open Finance	1 minute 15
4:30	Demo: AI sales workstation	4 minutes
8:30	Closing	30 seconds

PREPARATION

- Deck on slide 1. Second tab: AI sales workstation in banking mode, language EN, first name stored for the greeting. Set the institution once to "Zukunftsbank" in the demo settings; the choice stays in the browser.
- Click path demo (as in Banking Horizon 2030): Landing, type "Su" and accept "Summary of today", Overview (agent bar), Life-Event Radar and Churn Radar, AI Sales Assistant bottom right, chip "My new leads" (first thinking, then the number with a jump to "Leads", then Klaus Fischer as a card with photo), "Open customer", tab "Master Data", tab "Financial Overview" (external links with consent status), tab "Leads", expand "Property financing consultation" (AI summary with three signals, liquidity trend, rate scenarios, at a glance, actions), "Draft letter", clock in the header one day ahead, Master Data activity "Customer confirmed consultation", click opens the AI meeting preparation.

0:00 Opening: what I will do today

30 seconds

> Slide 1 is up.

- Thank you for having me.
- I would like to use the next few minutes for three things.
- First, a short look at what is already possible with AI today, including Claude Code, which is coming to all of us.
- Second, a short insight into a real demo, so you see what this looks like in practice.
- And third, a quick pointer to a hackathon that we are currently planning in the background.

0:30 Context: what AI can already build

1 minute

- Let me start with the possibilities.
- AI changes how we work: we can now build pitches, workshops and greenfield solutions ourselves, instead of only describing them on slides.
- I am currently part of the Claude Code pilot myself, and through it I have been able to build quite different things, some of which you see here.
- As far as I understand, a larger company rollout is planned.
- Independently of that, we are planning a hackathon in Banking in Q4, where every participant will get Claude Code access to implement new use cases themselves.
- And as a side note: you do not have to wait for that.
- With Copilot and Mindflow, simple click paths can already be built today, and there are ready-made agents there that we can already use.
- What is missing at that point is the backend: real data, logic and a working application behind the screens.
- And that is exactly what Claude Code makes possible.

1:30 Slide 1: Four fields

1 minute 45

> Point to the four screenshots from left to right, top to bottom.

- Let me walk you quickly through four fields.

> Point to 01.

- First, interactive workshop formats.
- This is Banking Horizon 2030: a bank building you can walk through, where every floor is a chapter with trends, a data point, our hypotheses and a tool to touch.
- Instead of forty slides, we walk clients through their own bank of the future.

> Point to 02.

- Second, prototypes of a target system.
- This is our AI sales workstation for Open Finance, and I will show it to you live in a moment.

> Point to 03.

- Third, real workflows.
- We used this one with ERGO to walk through the target process together with the client: a broker email arrives as free text, AI structures it, builds a cover sheet, checks it and closes the case.
- That target process is now being implemented.

> Point to 04.

- And fourth, image and video generation.
- This is the operations scene from Banking Horizon, a day in the life of Mara in 2030.
- The scenes and the transitions between them were generated with AI.

> Right column.

- So the message is: AI can now orchestrate and build topics like these really well.
- Copilot and Mindflow get you to the click path, and Claude Code adds the backend and turns it into a working solution.
- That is where the real magic happens.

> Hackathon box.

- And the hackathon in Q4 is exactly the place to try this yourselves.

3:15 Slide 2: Focus on Open Finance

1 minute 15

> Next slide.

- Now I would like to put the focus on Open Finance, and on a tool that we have discussed with many clients over the last months to show the value of AI in sales: our AI sales workstation.
- Earlier today, Marie and I also showed it in a webcast.
- We used it above all for one thing: discussing FiDA with clients.
- FiDA, the proposed EU regulation on Financial Data Access, which is currently on hold at EU level, is a very abstract debate.
- What does access to a customer's external financial data actually change in sales?
- With the prototype, that question becomes tangible: signals, next best actions, meeting preparation.

> Dark box.

- And one thing makes this very current: since August 2026 there is Claudeforce, the partnership between Anthropic and Salesforce.
- Claude works inside Salesforce, and Salesforce inside Claude, on live CRM data.
- So what you are about to see is not a vision for 2030.
- It can be built with standard technology today.
- Let me show you.

4:30 Demo: AI sales workstation

4 minutes

> Switch to the demo tab. Landing page with "Welcome back".

- This is our AI sales workstation, a demo with synthetic data.
- What we see here is the advisor's landing page.
- You do not start with a static menu but flexibly: via chat or voice you put together your screens and workflows dynamically.
- We start with a summary, so I type "Summary of today" and launch my dynamic cockpit.

> Type "Su", accept the suggestion "Summary of today". Overview with the agent bar.

- What I see here are many data tiles, and overnight, agents have been working: signals about life events, churn risks, campaign matches, prepared meetings.
- The advisor sees results, not raw data.

> Life-Event Radar: Andrea Lang, practice expansion. Churn Radar: Stefan Braun.

- In the Life-Event Radar, for example, I see that my client Andrea Lang has probably expanded her practice, together with the data points that led to this assessment.
- Or for my client Stefan Braun, that there is a churn risk.
- But I can also have AI generate completely new sales leads, and I do that here via my AI chatbot.
- Let me take you along one path: from the assistant to the client to the lead.

> Open the AI Sales Assistant bottom right, chip "My new leads".

- I ask the assistant for my new leads.
- It gives me the number from the overnight run and also shows me a top lead: Klaus Fischer, property financing, with a short summary.
- One click, and I am in his file.

> "Open customer", tab "Master Data": living situation, pets with detected transactions.

- Here I see all data points that come together in house and from outside, including hints from account transactions about the living situation or possible pets.
- The household profile adds further information, such as detected activities that can affect the insurance situation.

> Tab "Financial Overview".

- In the financial overview I see accounts, securities accounts and contracts at my own institution, but also at seven other institutions.
- With PSD2 and the client's consent, this is already possible today.
- The AI calculates investment volume, loan volume and net worth, and points out things like the concentration risk in the securities account.
- With FiDA, further data would be added with consent, for example on insurance.

> Tab "Leads": bank products, investment products, insurance products.

- In the Leads tab we now see where the potential lies.

- Per cluster there are different leads the AI has identified for this client.
- And keep in mind: for one client it might be fine to keep an eye on all the data yourself.
- But as a bank advisor, retail or corporate, you quickly have three or even four digits' worth of clients, and only AI can really interpret data volumes like that properly.

> Expand "Property financing consultation" with the "Top lead" badge.

- Let us expand the lead "Property financing consultation" and see what the AI has derived: three independent signals.
- The account transactions show that an instalment loan ends in two months, so liquidity is freed up, detected proactively rather than reactively; a building savings contract of 30,000 euros is ready for allocation; and a newsletter on real estate is opened regularly.

> Show the action "Draft letter". Then the clock top right in the header: one day ahead. Tab "Master Data", activities: "Kunde hat Beratungstermin bestätigt", click opens the AI meeting preparation.

- I can now have AI draft a letter to the client directly.
- Anyone who wants to can of course let agents run this automatically.
- And if I now move to the next day, I see that my client has replied to my email, and with one click the AI prepares the meeting for me as well.

> Classification, look into the room.

- Everything we have shown in this small demo is not 2030, it is 2026.
- With Claudeforce, what you see here can be built today with standard technology in a bank's CRM.

8:30 Closing

30 seconds

> Back to the deck, slide 1 or 2.

- My takeaway in one sentence: AI no longer just answers, it builds, from the pitch and the workshop format to the working prototype.
- The pilot shows what is possible, and the hackathon in Q4 is your chance to try it yourselves.
- Thank you, and I am happy to take questions.

Facts for questions

Claudeforce: announced by Salesforce and Anthropic on 26 August 2026. Claude works as a reasoning model inside Salesforce, and "Salesforce in Claude" is a plugin with 37 prebuilt sales skills, among them meeting preparation, deal health review, pipeline review, drafting emails and updating CRM records. Available to select pilot customers first, open beta announced for September 2026. Source: Salesforce press release, 26 August 2026, https://www.salesforce.com/news/press-releases/2026/08/26/salesforce-and-anthropic-announce-claudeforce/

Earlier step: on 14 October 2025 Anthropic and Salesforce expanded their partnership for regulated industries, with Claude as a foundation model of the Agentforce 360 platform and industry solutions starting with financial services.

FiDA: the proposed EU regulation on Financial Data Access. It would extend the idea of open banking under PSD2 to further financial data, for example insurance, investments and pensions, always based on the customer's consent. The proposal is currently on hold at EU level.

Demo: all data in the AI sales workstation and in Banking Horizon 2030 is synthetic. The live demo runs in banking mode with the institution "Zukunftsbank" and the same click path as in the Banking Horizon 2030 talk.
